IT 351 Human Computer Interaction Lab 5 – Personalized Voice Assistant

P Akshara - 181IT132

A voice assistant is a digital assistant that uses voice recognition, speech synthesis, and natural language processing to provide a service through a particular application. In general they react to voice commands and give the user relevant information about his/her inquiry. Presently, voice assistants are already able to answer questions, process orders of products, perform actions like playing music or start a simple phone call with a friend.

Supported Voice Commands & Actions

The voice assistant aids in

- 1. **General greetings** Responds with an appropriate greeting
- 2. **Drafting Email** Sends an email to an intended recipient
- 3. **Sending SMS** Sends an SMS to an intended recipient with the spoken message
- 4. **Setting alarms** Create alarms with customizable alarm tune
- 5. Making phone calls Speed dial an intended recipient
- 6. **Maintaining a to-do list** Add/remove items to a to-do list
- 7. **Current location** Tells user location based on device location
- 8. **Opening apps** Opens apps such as camera, browser
- 9. Current time Tells the time in HH:MM:SS format
- 10. Today's date Tells today's date in MM:DD:YYYY format
- 11. Other actions result in "I do not understand that command" message from the assistant

These actions are initiated by the user (identified using Speech-to-text conversions) when they speak a particular command and give the action specific details like recepient's/contact's name/phone number and message.

For example,

"send SMS" followed by the contact number/name with the desired message will send an SMS to that person.

"Tell time" gives the current time.

Conclusion

This a simple graphical user interface that provides the necessary functionalities which can be easily used by the user, with speech to text support.
